

DAF - AUDIO SYSTEMS

FOR AN EASY AND SAFE DRIVE AND MULTIPLE USE USB/AUX CONNECTOR

Truck Navigation Radio (TNR)

The Truck Navigation Radio bundles a wide range of audio, navigation and communication functions in a single compact unit conveniently integrated in the dashboard. In addition to AM/FM radio reception, the audio system plays CDs and MP3 music files on the integrated CD drive or via the external USB and AUX connectors.

Navigation

As soon as the destination and the vehicle specific data, such as dimensions, weight and axle loads, have been entered, the navigation system will start the route calculation. During this calculation the vehicle data are compared with the digital map information stored on the SD card, like the height of underpasses, the road width or the maximum allowable weight on bridges. The result is a route suitable for the specific vehicle, avoiding villages with narrow streets or winding roads that would require difficult manoeuvring.

Display

The display can also be optionally used for such other functions as a rear-view camera, which makes it much easier to manoeuvre large vehicles in reverse.

Audio system

The audio system is made for the playback of several different media types. Thanks to the external USB and AUX connectors, a memory stick or iPod can be connected. The audio data are transmitted digitally via USB to the Truck Navigation Radio system. The large colour touch screen makes it easy to search for radio stations or select a song title from the sound files, providing an excellent overview of the program and music selection options. Thanks to a Bluetooth interface, audio data can be streamed from a music carrier to the radio.

Functions

Basic functions and values can be adjusted in a main menu and with the steering wheel switches. The general radio functions, such as scanning stations, radio text and audio functions, such as sound and balance, are shown on the instrument panel.

DAF - AUDIO SYSTEMS

FOR AN EASY AND SAFE DRIVE AND MULTIPLE USE USB/AUX CONNECTOR

24V DAF radio/USB player

Innovative features, designed to meet the highest requirements and optimal sound, combined with ergonomic design, the DAF radio/USB player has been specially developed to meet the professional demands of 24V vehicle electrical systems. The radio/USB player comes with an excellent two speaker system mounted in the doors.

Functions

Basic functions and values can be adjusted in a main menu and with the steering wheel switches. The general radio functions, such as scanning stations, radio text and audio functions, such as sound and balance, are shown on the instrument panel.

USB/AUX connection

On this CD-less 24V DAF radio/USB player no longer the old-fashioned CD player is available, but it has a Smart Compartment at the dashboard centre console, which allows connection for virtually all MP3 players, USB sticks or iPods.

What are the benefits of the USB/AUX connection?

Missing or scratched CD's and jumping tracks, it's all past. All music tracks are together in one device and can be carried over to each truck. Operate your memory stick music carrier via the radio controls or steering wheel switches.

Which connector is best?

When the USB connection is used, control functions can be used on the radio or the steering wheel switches. MP3 player data like ID3 tags are shown on the instrument panel. With the AUX connection all control functions have to be managed on the music carrier.
